

Adjustable Track Bars

A track bar helps keep the axle centered under your Superduty and this bracket keeps it at the proper angle. Approximately 90% of Superduty trucks have a 1" diameter cast iron track bar. However, in 2002 Ford decided to use a 3/4" steel track bar on some of them. If your truck has the 3/4" track bar, you will need to upgrade your kit to include an adjustable track bar, rather than the bracket. This is because the 3/4" steel bar is not strong enough and will bend under strain once you lift the front end of your truck. Even if you have the 1" track bar it is still a great upgrade. This is because the track bar bracket is not as strong as the adjustable bar. Also, the nature of the cam bolt in the track bar bracket is such that it can work itself loose over time and make a popping noise. This upgrade will help your front end from trying to move from side to side, and the adjustable track bar will let you adjust it to keep it centered.

| Year | Description | Lift | Part # | Pricing |
